Question 1.

The Vision is broad and zones in on resilience and emission reduction.

The Goals:

- We need more than just the government vehicles to be electric, all public transport and all new cars need to be electric by 2030.
- I don't know how we reduce the emissions of all the tourists flying in to the state but some efforts to have a condition of them making some effort to offset their emission used in getting here.
- High quality information. Much more awareness of the truth as read in the IPCC report is necessary and important. We all need to understand the dangers and be informed about what to do, starting in schools. This is not nice but facing it and teaching resilience is more healthy than protecting from something so existential for the public. Today's children will be coming up with the solutions and dealing with the consequences, let them be part of the process now with honesty about how they can best make choices. By 2030, there will be more suffering, ill health and destruction of the environment.
- Everything in government should have a filter of whether it will affect people's resilience and their lifestyle by the impacts of any emissions.

Question 2.

I think this should also include the health and wellbeing of the community with a separate lot of specific areas: mental health, physical health, wellbeing – including how best to support people who have anxiety about the future of their family, of themselves and the systems they take for granted as part of a wealthy democracy. Included should be giving the vote to the people whose future is most threatened, reduce it to 16 years.

Question 3.

In information and Knowledge. Like lots of things this will result in some educated will be disastrous and result in conflict if not made more equitable. It needs to be on all avenues of media, not just ABC etc. Ensure science is used to inform, a stamp on misinformation. Use the IPCC report as the basis of public information. Make it every person's go to information.

Question 4.

Action needs to be all inclusive, Reduction and Resilience for everyone and everything, not just industry. Be ambitious not just good enough to pass a test. Aspire to the highest goals possible with life of the planet and human beings as priority, not the economy.

Question 5.

Communities need to be assisted to form groups to support each other and build resilience against climate events and conflicts that arise in fear and emergencies. Local Councils to have more say and they can represent the community. Grass roots support, local people know what matters. Protect the forests from fires, massive sinks of CO₂.

Question 6.

Stop native logging, coal and gas developments.

Electrify all households over time. As old wears out replacements to be only electric.

No carbon credits. Dodgey.

All renewable projects have a national stringent standard that meets environmental and social standards, in line with IPCC report..

New projects to have Tasmanians as the priority not as in Marinus, results in us having higher prices to pay for sending energy interstate.

Review Marinus with IPCC report as a measure.

Reduce voting age to 16.

Tighten up the funding of Political parties by unknown sources.
